I. Introduction

Situated on the Indo-Chinese peninsular, Thailand is blessed with 1,785 km. shoreline on the Gulf of Thailand and 740 km. on the Andaman Sea which endow with rich fishery resources. Fisheries sector has contributed significantly to the country’s economy. Apart from generating substantial incomes and employment, it also supported the various downstream industries, e.g. ship building and fish processing industries. Fishery products are a main source of animal protein in the diet, and are an important foreign currency earner. Fishery products are not only consumed domestically, but also exported. Thailand’s per capita fish consumption during the past decade ranged from 25 to 35 kg. The value of fish exported has continued to grow.

Current evidence indicates that marine fisheries in Thailand have been rapidly developed. Thailand is ranked among the top-ten fishing nations in the world.

II. Annual Fisheries Information

A. Domestic Tuna Fisheries

Thai vessels are fishing for neritic tunas in the Gulf of Thailand and in the Andaman Sea within the legal framework of Thai jurisdiction. The main commercial species of small tunas caught are frigate tuna, kawakawa, and longtail tuna destined mainly for tuna canneries. The other species found with a small quantity in the Gulf of Thailand and in the Andaman Sea include dogtooth tuna, bullet tuna, and skipjack. Fishing gears employed are light luring purse seine, Thai purse seine, and king mackerel gill net.

Thailand contributes small amount of tuna production each year. Table 1 shows its tuna fisheries production compared to the world total tuna catch from 2006 to 2010. Catch of tunas decreased from 73,970 tons in 2006 to 28,912 tons in 2010. The production in 2010 accounted for 0.75 % of the world tuna production.

Apart from regular fishing for neritic tunas within its national jurisdiction, Thailand has developed a large-scale tuna fishing fleet and ventured out to fish in the distant areas since 2000. In fact, the area of fishing operation is generally in the Indian Ocean due to its proximity to Thailand.

Having a large scale tuna canning industry and situating in a strategic location, Thailand has a pivotal policy and aspiration to operate in tuna fishing in the Indian Ocean particularly in the high seas with an aim to provide steady supply of raw materials to support the need and requirement of our rapid development in tuna

---

1 Tuna statistic in 2008 onwards shows only catches taken by the Thai fishing vessels in its Exclusive Economic Zone. The declining production does not what so ever represent the depletion of neritic tuna fish stocks.
canneries. If such aspiration becomes successful, Thailand will be able to reduce its dependency on importing of a large quantity of tunas around the world and is capable of providing raw material to its tuna canning industry.

With respect to tuna fisheries in the Indian Ocean, Thailand apparently has authorized 2 large-scale tuna longliners to operate in the Competent Area. Nevertheless, a fleet of 4 industrial purse seiners was used to fish in this area before ceasing it operation, and they were sold to the new vessel owners and no more longer operating in the Indian Ocean. In addition to the above-mentioned fishing vessels, 3 Thai research vessels have been used to conduct scientific researches in the Indian Ocean.

Currently, Thailand still lacks of capacity to venture to operate in the WCPO.

**B. Tuna Processing Industry**

Rapid fishery development has driven Thailand to become one of the leading countries in tuna industry in particular having tuna canneries and exporting of tuna products. Due to limited national tuna fishery production, Thailand has to rely on import of a large amount of tunas in order to meet the high demand of raw material in its tuna processing industry each year.

Four main tuna species has been used for tuna cannery which are skipjack, albacore, yellowfin and bigeye. Thailand regularly imports 800,000 – 900,000 tons of frozen tuna caught in the Pacific and Indian Ocean per year to supply for its tuna canning industry. Nevertheless, the import declined in recent year from 831,008 tons in 2010 to 787,089 tons in 2011 (Table 2). The main suppliers are Taiwan (20 %), U.S.A. (15 %), South Korea (11 %), Vanuatu (9 %), Japan and ASEAN (7 %). Around 80 % of the imported tuna products are skipjack, followed by yellowfin and albacore. Other tunas and bigeye account for about 1 %.

The price of imported tunas has been increased over the years and continues to grow significantly. The Bangkok CIF increased from 1,303 U.S. dollars in 2007 to 1,772 U.S. dollars in 2011 or 26 % increase in the average price. The first quarter of 2012 also showed the increasing of Bangkok CIF to 2,021 U.S. dollars or 80 percent increase compared to the same quarter last year.

Twenty-four canneries are producing canned tunas for export. Each year, Thailand can generate 800,000 tons of canned tunas. The tuna industry generally supports 40,000 workers and the canneries are located mainly in Samutprakarn Province, Samutsakorn Province, Songkla Province and Surat Thani Province.

Table 2 Import of Tuna Production of Thailand from 2008 to 2011 (Ton)
Markets for tuna products from Thailand mainly canned tunas spread in every region around the world. The U.S.A. is the main market which accounts for 23% of the total value of 9,363 million baht, followed by the EU (17%), Africa (10%), Japan (8%) and Australia (7%).

Table 3 demonstrates the producing cost of canned tuna in which 55-57% is originated from imported raw materials. Therefore, price volatility of tuna fish production in the market will eventually have a strong effect to the producing cost of the Thai tuna canneries.

C. Cooperation between Thailand and the WCPFC

Currently, Thailand is a Cooperating Non-Member (CNM) to the Western and Central Pacific Fisheries Commission (WCPFC). It has participated in the WCPFC through the principle specified in the Conservation and Management Measure (CMM) 2009-11 that it has an interest in the fishery in the Competent Area. It requested the Commission for the status of CNM and was accorded for 2011. Stipulated in the CMM 2009-11, the renewal of this status must be requested every year, and the Eighth Regular Session agreed to grant a renewal of the CNM status for Thailand for 2012. In addition, the participatory rights of Thailand in the WCPO are
limited to the provision of carrier and bunker vessels. Thailand already submitted a request for renewal of its CNM status for the year 2013.

As a CNM, Thailand has continued its cooperative role in acquisition and exchange of fishery information and data from canneries located in Thailand with a view to facilitating the work of the Scientific Committee. Furthermore, it takes pride in cooperating with the WCPFC and pledges its commitment to make financial contribution as agreed upon by the WCPFC in the regular meeting. It commits to comply with conservation and management measures adopted by the WCPFC. Although, Thailand has no fishing vessels operating in the Competent Area, it accepts high seas boarding and inspection procedures.

D. National Research Programs

The following research programs are carried out by the Department of Fisheries of Thailand:

a. The Sampling Program on Tuna Longline Vessels Unloading in Phuket
   The program has been carried out and provides a lot of useful information regarding foreign tuna longliners fishing in Indian Ocean and landing their catches at the Phuket fishing port, Thailand.
   The purpose of this program is as follows:
   - Enhance data collection and processing system for tuna fisheries in Thailand
   - Improve and update data collection on tuna longline fisheries in the East Indian Ocean as well as information on the activities, nominal catches, catch breakdown by species and size composition for each species caught by tuna longliners unloaded in Phuket.
   The activities involve collecting the number of landings, catch, vessel operating (no. of trip), weight samples, interviewing, biological samples and other activities such as collection of information of shark, other species, and study age of the fish by using otolith.

b. The Neritic Tuna Fisheries in Thailand
   The department of Fisheries has engaged in data collection and processing system for neritic tuna fisheries in Thailand. The purpose of the program is to assess the precision of the current catch estimates by review and analysis of the existing data and comparing with catch estimates derived from alternate sampling activities. The landing surveys are conducted to collect fishing and biological data of neritic tuna, pelagic fish, and by-catch species. The activities at the landing places include collecting catch, effort (no. of trip), sizes by individual total length for pelagic fish and fork length for neritic tuna and tuna-like species and weight. For 2012-2013, the Department of Fisheries has carried out collection of data on tongol fisheries and the stock analysis will be undertaken.

c. Tuna Resources Survey in the Eastern Indian Ocean
   Thailand has conducted tuna resources survey in the Indian Ocean since 1988 (M.V. MAHIDOL has started since 1995). The purpose of the research program is to collect the relevant information of tuna distribution in the Indian Ocean in particular the Eastern Indian Ocean. The information derived from the research survey includes catch composition, catch rate, size of caught tunas, fork length frequency, and length-weight relationship. In addition, the information on water current, wave and wind condition, and other oceanographic observation has been collected.
