Progress Report on the Development of a Seabird Identification Guide for Use by tRFMOs

NADEENA BECK [1], YUKIKO INOUE [2] and WARREN PAPWORTH [1]

Abstract: At the Joint Technical By-catch Working Group (JTBWG) held prior to Kobe III the ACAP Secretariat offered to review the seabird identification guides currently used by the tuna RFMOs (tRFMO) with a view to collating the information that would best assist observers to accurately identify seabirds caught in fishing operations. Seabird identification guides have subsequently been obtained from two tRFMOs, as well as from some National Observer Programmes. An initial review of this and additional material has shown that a small number of species do not have sufficient distinguishing characteristics that would allow their certain identification across all relevant age classes. In these cases, an alternative method, such as DNA analysis, may be required for species-level identification.

Progress Report on Development of Seabird Identification Guide for Use by tRFMOs

Authors: Dr Nadeena Beck, Dr Yukiko Inoue, Mr Warren Papworth

At the first meeting of the Joint Tuna Bycatch Working Group, which preceded Kobe III, ACAP offered to review the seabird identification guides currently used by the tuna regional fisheries management organisations (tRFMOs), with a view to producing a consolidated version that could be used by all tRFMOs, thereby assisting with the harmonisation of data collected by them. The guide is primarily intended for use at sea by fisheries observers to assist in the identification of seabirds killed in longline operations.

A number of seabird identification guides from national observer programmes were also reviewed, to assess whether these contained methodologies and/or information that would add to the value of the identification guide. One approach in particular was deemed to add additional value to the approach currently being taken with many of the guides. This was the use of photos of seabirds that had been caught as bycatch, which the Japanese national observer programme incorporated into their identification guide. The Japanese Fisheries Agency (JFA) kindly contributed a selection of their photos of dead seabirds to the draft identification guide presented in this paper.

Currently, the intention is to develop a ‘pocket’ guide for use on deck which will be complemented by a more comprehensive guide and possibly a web-based key. The pocket guide will be small in size with as
few pages as possible and contain the minimum of information and photos required for species identification. The larger guide will contain more information and more photos.

The pocket guide is still being developed but an indicative draft of the larger guide is attached. At the moment, the draft deliberately errs on the side of too much information, some of which may not be necessary.

There are a number of questions that need to be answered before the guide can be completed and these are referred to the WCPFC-SC for its advice. These questions are:

**Questions:**

1. Are there any species not included in the list which should be?
2. Are there any species on the list which don’t need to be?
3. Is there information missing from the guide which would be of use?
4. Is there information included in the guide that is unnecessary?
5. Is the species identification information accurate?
6. Are there any characteristics which would not be useful at sea?
7. Where there are insufficient physical characteristics available to be confident about the identification of the seabird, should an alternative method be used to achieve this, such as DNA analysis?

It is recommended that the draft guide be circulated to relevant observer programmes for their comment/input into the development of the guide and for their assistance in answering the questions above.

**Species list**

The list of species included in the guide was compiled from existing RFMO species guides (IOTC, CCSBT) and RFMO databases of bycatch species. Currently, only albatrosses, petrels and shearwaters have been included, and only those for which multiple records of capture by longline fisheries could be identified. In total 36 species are currently included. The IOTC guide also includes skuas, boobies and gannets, and frigatebirds. These have not been included in the draft guide, but could be easily included if it was thought appropriate.

### Phoebetria
- Sooty Albatross \textit{Phoebetria fusca}
- Light-mantled Albatross \textit{Phoebetria palpebrata}

### Phoebastria
- Waved Albatross \textit{Phoebastria irrorata}
- Black-footed Albatross \textit{Phoebastria nigripes}
- Laysan Albatross \textit{Phoebastria immutabilis}
- Short-tailed Albatross \textit{Phoebastria albatrus}

### Thalassarche
- Atlantic Yellow-nosed Albatross \textit{Thalassarche chlororhynchos}
- Indian Yellow-nosed Albatross \textit{Thalassarche carteri} (formerly \textit{T. chlororhynchos carteri})
- Grey-headed Albatross \textit{Thalassarche chrysostoma}
- Black-browed Albatross \textit{Thalassarche melanophris}
- Campbell Albatross \textit{Thalassarche impavida}
- Buller's Albatross \textit{Thalassarche bulleri}
- Shy Albatross \textit{Thalassarche cauta}
- White-capped Albatross \textit{Thalassarche steadi}
- Chatham Albatross \textit{Thalassarche eremita}
- Salvin's Albatross \textit{Thalassarche salvini}

### Petrels
- Southern Giant Petrel \textit{Macronectes giganteus}
- Northern Giant Petrel \textit{Macronectes halli}
- White-chinned Petrel \textit{Procellaria aequinoctialis}
- Spectacled Petrel \textit{Procellaria conspicillata}
- Black Petrel (Parkinson's Petrel) \textit{Procellaria parkinsoni}
- Westland Petrel \textit{Procellaria westlandica}
- Grey Petrel \textit{Procellaria cinerea}
- Cape Petrel \textit{Daption capense}
- Great-winged Petrel \textit{Pterodroma macroptera}

### Shearwaters
- Flesh-footed Shearwater* \textit{Puffinus carnipes}
- Sooty Shearwater* \textit{Puffinus griseus}
- Wedge-tailed Shearwater* \textit{Puffinus pacificus}
- Great Shearwater* \textit{Puffinus gravis}
- Short-tailed Shearwater* \textit{Puffinus tenuirostris}

* Non-ACAP listed species.
Photos

Below are examples of the photos which would ideally be included in the guide for as many species as possible. Of these, the head shots are the most important. If possible, we would like to include photos of both adults and juveniles, particularly where juveniles may look quite different (e.g. Thalassarche).

The Keys

The guide will include a number of keys to assist in identification. At the moment, only the albatross keys have been developed. Where possible, species identifications have been based on those characteristics that are most likely to be preserved in dead birds that may have been underwater for long periods of time. It has been assumed that in most cases, these are bill characteristics, primarily size and colour, followed by head plumage and ocean basin and that these will be able to discriminate between most species. It has been assumed that other characteristics, such as subtleties of wing plumage, may not be available or useful on dead birds.

However, where a characteristic will separate two otherwise indistinguishable species it has been included even though that characteristic may not always be available. These keys are based on information compiled from guidebooks and photos rather than from practical experience in identifying seabirds. Therefore, it has not always been possible to assess the reliability of some characteristics as distinguishing features, in particular, ocean basin. Also, a lack of photos has made it difficult to assess the distinguishing features of the juvenile Thalassarche to fit them into the key.

Table 1 lists the features used to develop the albatross keys found on pages 4 and 13 of the draft guide.

Juvenile Thalassarche Key Page 27
Campbell Albatross
*Thalassarche impavida*

**ENDANGERED**

**Bill length:** 105-118 mm  
**Wing length:** 49-54 cm  
**Body length:** 80-95 cm

**Distinguishing features:**
- Pale iris
- White head, white body, dark mantle and upper wings
- Bright orange bill
- Dark eye patch
- Juveniles similar to adults, pale grey head, pale brown/grey bill with black tip
- Generally not found in west Indian or Atlantic Ocean

**Similar species:**
Adults distinguished from Black-browed (pg 18) by pale iris. Juveniles are indistinguishable. Juveniles may also be confused with juvenile Grey-headed (pg 22) and Buller’s (pg 23). May be distinguished from juvenile Grey-headed by paler bill and Buller’s by dark underwing.
Grey-headed Albatross
*Thalassarche chrysostoma*

**VULNERABLE**

**Bill length:** 109-121 mm  
**Wing length:** 50-55 cm  
**Body length:** 70-85 cm

**Distinguishing features:**
- Grey head, white body, dark mantle and upper wings
- **Black bill with yellow upper and lower ridges**
- Yellow upper ridge tapers towards base
- White eye crescent
- Juveniles similar to adults, greyer head with variable white cheek patch, blackish-brown bill with black tip, all dark underwing, lightening with age

**Similar species:**
Distinguished from Buller’s Albatross (pg 21) by less extensive yellow on bill. Yellow upper ridge tapers at base rather than forming broad, rounded base. Juveniles may be confused with juvenile Black-browed and Campbell albatrosses (pg 18-19) but distinguished by darker bill.
